ABSTRACT

Malignant histiocytosis (MH) is a rare hematologic malignancy, especially in the first decade of life. The disease is clinically characterized by fever, hepatosplenomegaly, lymphadenopathy, pancytopenia and jaundice, and histologically by systemic proliferation of malignant histiocytes and hemophagocytosis. The prognosis is poor and often the diagnosis is not made before death. Because of the rarity of this disease, it is unusual for practitioners to diagnose it by bone marrow aspiration (BMA) alone.

INTRODUCTION

MH was introduced in 1966 by Rappaport, although this disease was originally described in 1936 by Scott and Robb-Smith under the name of histiocytic medullary reticulosis. The disease is classified as class III of the histiocytosis syndrome and is a rare, nonfamilial, rapidly progressive and fatal neoplasm of true histiocytes that affects children and adults with a mean age of 31 years. It accounts for less than 10% of hematopoietic malignancies with an average of one case per year. The male to female ratio is 2.2:1 and it may be associated with primary mediastinal germ cell tumors in males.

CASE REPORT

A 5 year old girl was referred to our hospital with fever and knee pain of 2 days' duration and constipation. On admission there were no abnormal physical findings except fever (axillary temperature=38.5°C) and limping. Her general appearance was good. Routine laboratory examinations revealed only mild normocytic, normochromic anemia (Hct=33%), abnormal ESR (110 mm/h) and a positive CRP. During the hospital stay arthralgia subsided, and all other examinations and cultures were negative. Radiography of the knees showed leukemic translucent lines. The peripheral blood smear was normal. Bone marrow aspiration was performed and reported as acute undifferentiated leukemia. The second BMA was reported as ALL(L3), and the patient was treated by the standard ALL protocol. At the end of induction of remission she was admitted for the 3rd time with intractable bleeding from buccal ulcers, abdominal pain, diarrhea and melena. Upon physical examination she was very ill with severe weight loss and cachexia. Cervical

lymph nodes, liver and spleen were palpable but smaller than before. A surprising finding was ascites and abdominal distention.

BMA and peripheral blood smear indicated no response to treatment, therefore the original aspirate specimens were reviewed and prominent hemophagocytosis with atypical, blast-like histiocytes was noticed (Figs. 1, 2, 3) which was unappreciated initially. Non-specific esterase staining of the cells was positive, thus the diagnosis of MH was made based on BMA findings. The peripheral blood smear showed atypical histiocytes (Fig. 4).

COPAD regimen was used for chemotherapy but on the second day of therapy, the patient suddenly developed periorbital edema and died. Autopsy was restricted only to needle biopsies of the liver and spleen. The liver specimen was normal but the spleen biopsy was compatible with MH (Figs. 5, 6, 7).

DISCUSSION

Etiology

MH is a nonhereditary disease of unknown etiology. Although aneuploidy and some complex chromosomal abnormalities have been reported [t (8;16) (p11, p13) and t(5;6) (5q35;6p21)], there is no significant genetic abnormality.

Clinical manifestations

Fever, localized or generalized frequently tender lymphadenopathy and weakness are the most common initial presentations. Hepatosplenomegaly, skin lesions, back, chest and abdominal pain, sweating and a soft tissue mass are also frequent findings. Jaundice is seen later in the course of disease and blanching but may change to raised nodular lesions. Other less frequent presentations include CNS involvement with positive CSF cytology, respiratory symptoms, GI symptoms (GI bleeding & diarrhea), buccal ulceration and
Laboratory findings

Hematologic: Anemia is the most frequent finding (75%) followed by thrombocytopenia (58%), leukopenia and pancytopenia (21%). Coombs’ positive hemolytic anemia, thrombocytosis, leukocytosis, monocytosis, circulating histiocytes and fibrinopenia are infrequent findings.

Biochemical: Liver enzymes are often increased, especially LDH (33%). Serum bilirubin levels above 2 mg/dl are present in about 29% of patients. Hypoalbuminemia, hyponatremia (<130 mEq/L) and hyperuricemia are other infrequent findings.

Hyp Ferrit inaemia may be a significant indicator of MH.

Radiologic: Abnormal CXR has been reported in 33% of cases, although overt respiratory symptoms are rare. CXR findings include pleural effusion, hilar adenopathy and reticular patterns. Periosteal reactions and translucent zones have rarely been reported.

Immunology and immunohistochemistry: Positive RF, increased IgA and polyclonal hypergammaglobulinopathy have been reported by some authors. Histiocytes react with alphanaphthyl esterase and acid phosphatase and are inhibited by NaF and tartarate, respectively. Sudanophilia, PAS positivity and free iron staining which probably arise largely from phagocytic activity are also increased. The malignant cells also react with alpha antichymotripsin and antibodies directed against EMA, HLA-DR antigens, CD 25, CD 30, CD 68, CD 71, and S-100 protein. There are neither B- nor T-cell antigens. The degree of cytologic atypia and phagocytic activity is indirectly related to the quantity of lysozyme within the cells.

Diagnosis

Diagnosis is based on biopsy and erythrophagocytosis in the bone marrow, liver and spleen and histiocyte infiltration.

- WBC count and LDH and bilirubin levels do not seem to be important in outcome.
- Most patients die within a year of disease. In one series the median survival was 4 months with a maximum duration of 25 months.
- Hepatic and pulmonary dysfunction and platelet counts <150000 at presentation indicate a poor prognosis.
- The dose of drug delivered is another important prognostic factor.
- Age, sex, stage and site of disease, WBC count and LDH and bilirubin levels do not seem to be important in outcome.
- Overall mortality rate is 68% and all untreated patients die within weeks to months. Common causes of death are cerebral hemorrhage and pneumonia.

**Outcome**

MH is a rapidly progressive and fatal malignancy; only a few cases of long-term survival have been reported. Many patients die within a year of disease. In one series the median survival was 4 months with a maximum duration of 25 months.

**REFERENCES**

**Treatment**

Multi-agent chemotherapy with cyclophosphamide, doxorubicin, vincristine, prednisolone or etoposide and cytosine arabinoside may improve survival. Some effective regimens which have been used with relatively good results include COPAD, ACOP, CHOP, CVP and BACOP.

CNS prophylaxis may be done but its effectiveness is controversial. Autologous bone marrow transplantation has been reported with good results.

Discover the wide world of Islamic literature

The journal is produced to a very high standard, and should be a very useful source for all libraries and information users concerned with Islamic issues.

Information Development (London), Volume 7, Number 4, pages 241–242

This journal is doing a singular service to the cause of the publicity of periodical literature on Islamic culture and civilization in all its diverse aspects. Every scholar of Islamic Studies should feel indebted to you for this service.

PROFESSOR S.M. RAZAULLAH ANSARI
President, International Union of History and Philosophy of Science (IUHPS)
Commission for Science and Technology in Islamic Civilization, New Delhi, India

(Periodica Islamica is an invaluable guide...)
PROFESSOR BILL KATZ
Librarian (New York), Volume 118, Number 21, page 184

Periodica Islamica is a most valuable addition to our reference collection.

PROFESSOR WOLFGANG BEHN
Union Catalogue of Islamic Publications, Staatsbibliothek Preussischer Kulturbest, Berlin, Germany

It is recommended for all research libraries and scholars of the Islamic viewpoint.

PROFESSOR W. J. CUNNINGHAM
Multi-Cultural Review (Westport, Connecticut), Volume 2, Number 1, page 40

You should be congratulated on Periodica Islamica which should prove to be a valuable journal to persons interested in Islam and the entire Muslim World.

AMBASSADOR (RTD.) CHRISTOPHER VAN HOLLEN
The Middle East Institute, Washington DC, USA

Periodica Islamica is an international contents journal. In its quarterly issues it reproduces tables of contents from a wide variety of serials, periodicals and other recurring publications worldwide. These primary publications are selected for indexing by Periodica Islamica on the basis of their significance for religious, cultural, socioeconomic, and political affairs of the Muslim world.

Periodica Islamica is the premiere source of reference for all multi-disciplinary discourses on the world of Islam. Browsing through an issue of Periodica Islamica is like visiting your library 100 times over. Four times a year, in a highly compact format, it delivers indispensable information on a broad spectrum of disciplines explicitly or implicitly related to Islamic issues.

If you want to know the Muslim world better, you need to know Periodica Islamica better.
