Abstract

Background: Nursing shortage is an important and multifaceted challenge in the health systems and has reached a warning threshold. The factors associated with nursing shortage vary from country to country. Therefore, this study compared the causes of nursing shortage and suggested strategies to help resolve this concern both in Iran and in the world.

Methods: To conduct this systematic review, search was done in English and Persian databases from 2000 to 2016. In the preliminary review, 537 articles were included in the study. After reviewing the titles, abstracts, objectives, and results of articles, 32 studies were finalized.

Results: The important causes of nursing shortage in the world included aging of the nursing workforce, inadequate admission and training of nurses, aging population, and job abandonment. However, the leading causes in Iran were unwillingness and lack of desire to enter and remain in the nursing field, job abandonment, inadequate salaries, low social status, and negative perception of nursing. Proposed strategies in the world are increasing the salaries, redesigning the work environment, improving the public's perspective, retaining the existing nursing workforce, and flexible work schedules. In Iran, these strategies include increasing salaries and recruitment, enhancing the public's perception of nursing, and supporting nursing organizations.

Conclusion: Nursing shortage is a multifaceted concept with varying magnitudes in different countries. Therefore, the strategies to resolve nursing shortage should be based on the unique conditions of each country. The most important strategies to overcome nursing shortage in Iran are focused on the improving the retention of existing nursing workforce.

Introduction

The importance of human health resources and their key role in maintaining and improving the health of the community is agreed upon by health care providers (1). The

main problems of the hospitals, as the main provider of health care services, are rooted in the lack of manpower or its inappropriate distribution (2). Meanwhile, a nursing

↑What is “already known” in this topic:

Previous studies on nursing shortage have suggested some of the causes of nursing shortage and presented some strategies to address this problem.

→What this article adds:

In this study, the causes and strategies for addressing nursing shortage in the world and Iran were prioritized according to their importance. Having compared the causes of nursing shortage and the corresponding strategies, it became clear that increased age of nursing staff was the main cause of nursing shortage in the world, but unwillingness to enter and remain in the nursing profession was the main cause of nursing shortage in Iran. Nevertheless, the main strategy to overcome nursing shortage in Iran and the world is to increase nurses' salaries and rights.

team is a vital part of the health care system, and comprises about 56% of any hospital's staff (3). Thus, its shortage can reduce the quality of health care services (4).

Assuring the quality of patient care is the basis of nursing practice (5). Therefore, any defect in persistent provision of nurses to respond to care needs is a serious threat that can threaten the quality of care (6). Quality nursing care can decrease hospital infection, length of hospital stay, mortality rate, cardiac arrest incidence, and other complications (7). Various studies have pointed to a shortage of nurses as an obstacle against the efficiency and quality of care (8-10).

Nursing shortage is a major challenge to health care systems and has reached a warning threshold (11). This shortage becomes evident when there are not enough nurses to provide a certain level of care or to fill vacant positions and budget allocations (12). Nursing shortage is an international problem in progress. According to the World Health Statistics 2013, it is estimated that 1 million additional nurses will be needed by 2020 (13). Also, health workforce shortage is estimated to be 7 million, and is expected to reach 12.9 million by 2035 (14).

Nursing shortage is a complex phenomenon associated with many factors (15). One study identified several factors for nursing shortage: low salaries; bad working conditions; poor management; weakness of the authorities in employing work force prioritizing women for nursing profession; and preferring African, Spanish, and Latin nurses (16). Nursing shortage is the consequence of reduced university student admissions, elderly workforce, competition for employing skilled workforce (17), increased demand due to aging population and customer needs, rapid technological development (18), globalization of the labor market, and increased inclination of nurses for alternative jobs (19).

Nursing shortage problem is a multifaceted problem (20) and its associated factors vary from one country to another (21). The main causes of nursing shortage in the world are insufficient university student admissions, lack of faculty members, aging of nurses and their early retirement, aging of the society, and the need for more care, inadequate employment, increase of stress, low job satisfaction, and willingness to leave the job (22). However, in Iran, the main factors associated with nursing shortage include low social status, work-related injuries, early retirement, immigration, and willingness to abandon the current job, employment in other professions, housekeeping, low employment rates, and the increase of hospital beds (1). Due to the economic dependence of the health and medical centers on the government in Iran, these centers need to obtain the necessary credentials for employment of nurses, which can pose a restriction against nurse recruitment or university student admission (23). In Iran, currently the shortage of nurses is about 130 000. There are about 1.3 nurses per 1000 population, and it is anticipated that in 2020, there will be a shortage of 200 000 nurses (24). There is still a shortage of nurses in the United States although they have about 10 nurses per 1000 (20). Therefore, the concept of nursing shortage depends on the scope of practice for nurses, the geographic area of

activity, and the balance of supply and demand in that community (24). In Iran, the problem of nursing shortage is recognized as the most important challenge in the field of nursing and it is in contrast with its global concept, requiring unique strategies (21).

Different studies have examined different aspects of nursing shortage and there is no comprehensive view on this issue. In addition, due to the differences in the concept of nursing shortage with respect to the context and considering the differences in the proposed strategies, this study aimed to identify and compare the causes of nursing shortage and the strategies used to solve this problem in Iran and in the world using a systematic review of the related studies.

Methods

In this systematic review, PubMed, Google Scholar, Science Direct, Ovid, and Scopus were explored to obtain related articles in English and SID, ISC, Magiran, Iranmedex, Medlib, and Google Scholar were reviewed to find related articles in Persian. The search strategy and the method of selecting articles were agreed upon by the researchers. For data extraction, a form was developed by the researchers which included the name of the authors, publication year, causes of nursing shortage, and the suggested strategies. According to Medical Subject Headings (MeSH), the keywords of "medically underserved area", "shortage", and "nurse" were used individually and in combination to search. Only papers published from early 2000 to the end of 2016 were included in the study. To avoid bias, the search was performed by 2 researchers independently and by using a data collection form. Agreement was reached about controversial cases through scientific discussion. The inclusion criteria were having research standards based on PRISMA checklist, being relevant, and having structure. The exclusion criterion was the lack of access to the full-text or the required data. The studies were reviewed and selected in 3 stages. First, the title was reviewed, and unrelated articles were excluded. In the second stage, having read the abstract, the related articles were selected. In the third stage, all included articles were quickly reviewed and duplicate studies removed (24 articles). In case of lack of access to full-texts, an email was sent to the corresponding author requesting the full-text of the article. Studies with insufficient data or without text (5 papers) were excluded from the study. Then, the texts and documents collected by each researcher were carefully examined during a discussion. According to the defined inclusion and exclusion criteria, 32 articles were selected and analyzed, which included descriptive studies, systematic reviews, and qualitative studies. The search stages are shown in Figure 1.

In the initial search, 537 articles were found. Having reviewed the titles, 263 articles were selected. After studying the abstracts, 148 out of 263 articles were included. By assessing the full-texts, objectives, and findings of the selected articles, 25 related papers in the world and 7 related papers in Iran were finally selected for analysis. The results on the causes of nursing shortage in the world and Iran are presented in Table 1.

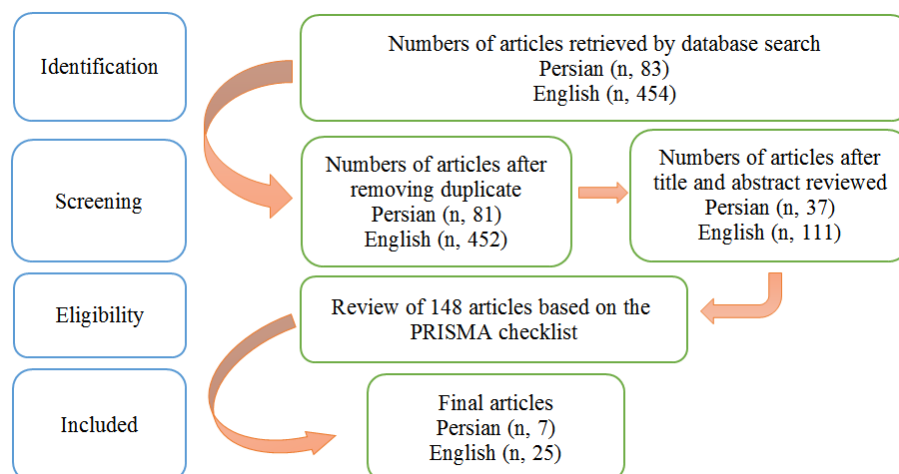

Fig. 1. Flow diagram showing the different phases involved in searching for relevant publication

Authors	Country	Causes	Strategies
Langan et al, 2007 (39)	USA	High workload, new technologies, lack of job security, insufficient support, family responsibilities, retirement, unclear personal reasons, lack of physical strength and ability, and lack of sufficient incentives	Increase of salaries, improvement of working conditions, creation of rest breaks, provision of health insurance, and provision of attractive supportive facilities
Oulton, 2006 (40)	Canada	Aging population, globalization and growth of private sector, increased demand for care, high workload, insufficient support, violence, stress and burnout, wage differentials, lack of participation in decision making, and changes in human resources approaches	Changing major health policies, improving improper internal distribution and preventing migration, and appropriate nursing leadership
Gassert, 2006 (41)	USA	-	Using alternative methods to compensate for the lack of faculty members and low number of student admissions such as using clinical faculties, simulated learning environments, and clinical information systems
Lynn et al, 2006 (6)	USA	-	Developing professional nursing leaderships, increasing support and communication with managers, creating training opportunities for nurses, eliminating compulsory overtime, increasing salaries, employing new nurses and increasing nurses to patient ratios, engaging nurses in problem solving, simple and effective documentation, flexible work schedules, establishing kindergarten, reducing off-duty activities, and improvement of nurses' retention
Lynn et al, 2005 (42)	USA	Job abandonment, financial status, organizational commitment, and low job satisfaction	-
Hooshmand et al, 2004 (43)	Iran	Job abandonment, failure to meet individual needs, low salaries, non-academic nursing position in the community, and lack of attention and support from authorities	-
Ulrich, 2003 (44)	USA	-	Increasing job safety, reducing stress, preventing non-nursing tasks, developing flexible work schedules, improving salaries, encouraging people to enter nursing, increasing education, employing greater numbers of men and minorities, and using various occupational grades
Janiszewski, 2003 (45)	USA	Aging nurses, decrease of admission, changing working conditions, and negative perception of nursing	Increasing employment rates, having access to unemployed and immigrant nurses, permanent education, nurses' retention, and improvement of public's perception of nursing
Ross, 2002 (5)	USA	Managed care, restriction of costs, aging nurses, decrease of number of nurses, aging population, and the need for more care	Increasing student admissions, improving nurses' retention and working conditions, acceptable patient to nurse ratio, and increasing salaries
Murray, 2002 (46)	USA	Aging nurses, decrease of admissions, increase of job opportunities for women, changes in the care delivery system, job burnout, and improper public's perception of nursing	Salaries increase, clinical leadership development, flexibility of work schedules, scholarships and tuition reimbursement programs, male nurse recruitment, changes in department curricula to increase outcomes, and nurse to patient ratio improvement, Occupational risk reduction and occupational safety increase, increase of support, using new technology, deploying nurses from other countries, participation of nurses in decision making, and improvement of the public's perception of nursing using media
Meadows, 2002 (47)	USA	Aging nurses, decrease of university students, and lack of job satisfaction	Employing young workforce, men, and minorities, improving public's perception of nursing, especially in schools, retaining existing nurses, using clinical information systems, auto-prescription of drugs, computerized physician order entry, computerized documentation

in Table 3.

Discussion

The most important cause of nursing shortage in the

world is aging of nurses. With regards to the phenomenon of increased baby boom between 1946 and 1964 (27), part of this generation who chose nursing have been either retired or will be retired in the next few years. Therefore,

Table 1. Ctd

Authors	Country	Causes	Strategies
Lee, 2002 (48)	USA	Aging nurses, decrease in supply, and increase in demand	Designing work environment using information technology and ergonomics, patient-centered staffing, hospital collaboration with faculties, and employing men and minorities
Zimmermann, 2000 (49)	USA	Aging nurses, decrease in admissions, increase in job opportunities and choices, increase in need for nurses, changes in demographic characteristics of the community, the desire of older nurses for part-time work, and changes in care delivery systems	Improving the employment and retention of nurses, deployment of unemployed and immigrant workforce, enhancing public's perception of nursing, overtime, changing the work environment, collaboration of nurses with different grades, and taking into account a mandatory ratio for employees

Table 2. The most important causes of nursing shortage in the world and in Iran in order of importance and priority

Causes of nursing shortage in the world	Causes of nursing shortage in Iran
Aging nurses and increase of retirement requests	Unwillingness to enter and stay in nursing
Inadequate nursing admissions and education	Job abandonment and trying other jobs
Aging population and increase of the need for care	Insufficient salaries compared to other professions
Job abandonment and employment in other professions	Low social status
Improper planning for recruiting nurses	The negative impression of nursing as a woman's career
Shortage of faculty members and nursing faculties	Poor policies and programs for recruitment of workforce
Low salaries and benefits	Immigration to other countries
Lack of support by managers and other staff	Insufficient support in the workplace

Table 3. The most important strategies to overcome the shortage of nurses in the world and in Iran in order of importance and priority

Suggested strategies in the world	Suggested strategies in Iran
Improving benefits and rewards	Increasing salaries and benefits
Redesigning and creating a healthy work environment	Increasing employment rates
Improving public's perception of nursing	Improving public's perception of nursing
Improving retention of existing nurse	Supporting Nursing Organizations and scientific associations
Flexible work schedules	Improving the work environment
Increasing the number of nursing faculties and students' admissions	Increasing nursing students' admissions

despite the entering of young nurses in the profession, the shortage of nurses is not over (50). The mean age of the registered nurses (RN) is about 46 years and a large number of them will be retired in the next 10 to 15 years (51). Nevertheless, the mean age of nurses in Iran is 35-38 years and this factor cannot lead to shortage of nurses in Iran (23).

One of the main causes of nursing shortage in Iran is the unwillingness and lack of desire to enter and stay in nursing or willingness to leave the job. The rate of job abandonment, the unwillingness of nurses to stay in their job, and comparing nursing with other occupations are highly important (52), such that the rate of job abandonment among nurses is 20% in the United States and it is estimated to reach 36% by 2020 (53). The high rates of job abandonment and lack of interest may be due to the fact that nursing is considered as a worthless profession for women in most countries (54). Although there are no statistics on the causes of lack of interest and willingness to stay in nursing in Iran (28), it seems that its low salary and benefits and low social level are influential factors contributing to this issue. In a study aimed at examining the process of Iranian nurses' job abandonment, it was found that dissatisfaction with the profession, management weakness, and inappropriate social status of nursing were the main causes of job abandonment of nurses in Iran (28).

The second leading cause of nursing shortage in the world is the inadequate nursing education associated with financial issues and academic shortcomings. In the United States, in 2012, nearly 80 000 applications to enroll for

undergraduate or postgraduate degrees were dropped due to inadequate faculty members, clinical environments, and classroom space (55). In Iran, inadequate nursing education is not the main cause of nursing shortage and it is ranked as the sixth reason. The low rank of this reason in Iran may be due to an effort made by relevant organizations to increase student admissions. In this regard, Abbaszadeh and Abdi quoted from the head of Iranian Nursing Organization that "the student admission capacity has increased from 7000 to 10 000 in 2011." (24)

The third leading cause of shortage of nurses in the world is an increase in the elderly population and the need for further care, resulting in increased demand and exacerbated nursing shortages. According to the UN report, from 2015 to 2030, the population over the age of 60 is projected to increase from 901 million to 1.4 billion (56), and the need for care and nursing will be increased subsequently (26). This is not the cause of nursing shortage in Iran, because the average age in Iran is 28.3 years (56). However, due to the increase in the population of the elderly, this problem will worsen the shortage of nursing in the coming years.

Insufficient nursing salary compared to that of other professions is the third leading cause of shortage of nurses in Iran. High salaries and benefits are one of the ways to attract and retain workforce (19, 39). This is the seventh cause of a shortage of nurses in the world, reflecting the low level of Iranian nurses' salary. In this regard, experts believe that to make sustainable changes, reforms should be developed in politics, laws, and public's perspective (57). Therefore, one of the reforms in the field of policies

and laws can be the implementation of a tariff plan for nursing services to increase the salaries of nurses.

Nurses' inadequate employment causes stress, low job satisfaction, and a desire to leave the profession (22). This factor is one of the important causes of the shortage of nurses in the world and in Iran, with almost the same significance. In Iran, most health centers are economically nongovernmental and government-dependent and have limitations for workforce recruitment (23). In addition, many studies highlighted the low employment rates due to financial constraints in the world and considered it as one of the major causes of nursing shortage (20, 22, 26, 31, 32).

Insufficient managerial support is one of the major causes of nursing shortage in the world and in Iran, with almost the same importance. Many studies pointed to the effective role of managers in the retention of the nurses and the reduction of job abandonment (20, 33, 36). One of the management's efforts to retain human resources is to create job satisfaction and prevent employees' dissatisfaction (58).

Other cause of nursing shortage in Iran is immigration nurses from Iran to improve their economic status and quality of life, although the exact statistics are not available (24). Developed countries compensate their nursing shortages by resorting to the recruitment of nurses from poor and developing countries (59).

Nursing shortage strategies have been categorized into 3 categories: (1) supply increase and demand decrease, (2) retention improvement, and (3) decrease of job abandonment. Moreover, the improvement of salaries and benefits has been the main proposed strategy to overcome nursing shortages in the world and in Iran. Since manpower is the main source of production and service delivery in organizations and the most important factor contributing to the survival and success of organizations (60), retention of existing staff can be achieved by offering financial incentives (19, 39).

Given that work-related factors are the most important causes of nursing shortage in the world, optimization and improvement of the work environment is the second proposed strategy (19, 22, 32, 33, 36, 61, 62). A better work environment for nurses is associated with reduced job dissatisfaction and job abandonment, which can successfully resolve nursing shortages (63). Therefore, nursing shortage cannot be solved with increasing student admissions, but long-term nurse workforce growth and retention can be achieved by providing a safe and supportive work environment for the nurses (19). In Iran, improving the work environment should be among the priorities for the resolution of nursing shortage, although this is not a priority among the proposed strategies.

The second strategy to solve this problem in Iran is increase in recruitment. In Iran, due to the centralized management system, the recruitment process is subject to limitations (23). Due to such limitations, researchers consider the support of the Nursing Organization as one of the strategies to deal with nursing shortage problem, as the Nursing Organization tries to create better nursing work conditions by reaching out to the Islamic Consultative

Assembly and other responsible organizations (21). However, studies conducted in different countries around the world have indicated that one strategy to recruit greater number of workforce is by providing nursing admission and recruitment for men, minorities, and different cultural groups (44, 46).

The third proposed strategy in Iran and the world is improving the public's view of nursing. In Iran, the social perception is one of the main reasons for nurses' dissatisfaction (64). Therefore, through promoting the public's view of nursing and familiarizing the society with the important role of a nurse using public media, the retention of existing nurses and recruitment of new workforce can be achieved.

Another important strategy used worldwide is improving the existing nurses' retention. The average of registered job abandonment among the nurses was about 17.2% in 2014 (65). However, the retention of the existing nurses can be increased and nurses' job abandonment can be reduced by improving salaries and benefits, improving the work environment, developing independence and professional power, supporting the existing workforce by the management team, and creating a flexible work schedule (19). Most researchers agree that retention of existing nurses is a priority (66). In Iran, various studies have also contributed to improving the retention of the existing nurses by providing strategies such as increasing salaries and benefits, optimizing the work environment, using nurses in other positions, improving the quality of professional life, transferring nursing staff among different hospital wards, and improving the employment status of nursing workforce (21, 24, 29, 30). Increasing the number of nursing students' admissions and the nursing faculties has been highlighted as an important strategy both in Iran and in the world. Admission of nursing students has been doubled in Iran in the previous years (64). Another strategy proposed in different countries around the world is to increase the recruitment of foreign nurses. Many studies conducted in the US have highlighted the importance of this strategy; thus, the NHS has asked the government to consider nursing in the list of occupation shortages and allow foreign nurses to enter the country without visa due to nursing shortage (67). In Iran, a reverse strategy should be used and necessary measures should be taken to prevent the migration of nurses from the country and develop conditions for their retention. However, this strategy has not been suggested in studies conducted in Iran.

One of the proposed strategies in Iran which is not done in other countries is to gain the support of the Nursing Organization and scientific associations. The suggestion of this strategy may be due to important role of the Nursing Organization in nursing-related policies (21). Therefore, nurses' retention, job satisfaction, social status, and recruitment can be achieved by supporting the Nursing Organization and improving the working conditions, benefits, and salaries of nurses.

Conclusion

To improve the retention of the existing nursing workforce, it is necessary to increase the salaries and

benefits in proportion to workload and other professions, improve the work environment, value nursing profession, gain managers' support, use nurses in diverse positions, develop flexible work schedules in accordance with personal life, and create employment opportunities for newly graduated nurses. The public's view of the nursing profession should be improved through familiarizing people from childhood with the vital role of nurses in the health system, improving the community's familiarity with the scientific position of the nurses in the hospital, and using the public media to show the important role of the nurses in hospitals. Nursing shortage can be overcome by increasing the admissions of nursing students at universities, taking into account the necessary requirements, and recruiting larger number of graduated nurses in accordance with needs of health care system.

Conflict of Interests

The authors declare that they have no competing interests.
