Abstract

Background: One of the critical factors affecting chronic diseases is the use of drugs, especially industrial substances, such as methamphetamine. Methamphetamine use is increasingly common among the younger members of society. Methamphetamine is not only physically and mentally destructive, but also has a significant impact on the families of abusers and society, and imposes a financial burden on society. The present study aims to identify the factors affecting methamphetamine use in a scoping review.

Methods: Different keywords of methamphetamine were selected in the Mesh database and were searched in valid English databases from January 1, 2008, to April 5, 2022. Inclusion and exclusion criteria in this study were languages, reported findings, time range, and type of article. This study was designed by scoping review method developed by Askey Malley'O.

Results: The total articles that were finally analyzed in this article were 42 including 12 English articles and 30 Persian articles. Among these articles, the most important factors affecting Methamphetamine are individual, social, and family factors, which have received the most cited.

Conclusion: The majority of research highlights the importance of individual factors, society, and family factors, respectively, while formulating policies for prevention, treatment, and rehabilitation must be considered. It is suggested that structural path analysis be determined by prioritizing the identified factors and the weights of these components

Keywords: Effective Factors; Methamphetamine Use; Individual Factors; Family Factors; Society Factors

Conflicts of Interest: None declared

Introduction

Drugs and drug addiction are considered one of the main health problems in any country, which threaten human health and life (1). There are different categories of drugs (2, 3). Methamphetamine is the most important addictive substance that is abused in most countries; however, the extent and consequences of this abuse vary significantly depending on the time and place (4, 5). There are at least 1300

stimulants in the world (6), of which amphetamine compounds and coca products are the most widely abused, especially among young people, such as a combination of ecstasy and methamphetamine (5). Methamphetamine is a stimulant and addictive substance whose main ingredient is amphetamine (C₉H₁₃N). This substance strongly stimulates the dopamine system of the brain and immediately

↑What is "already known" in this topic:

Various studies have investigated the factors affecting methamphetamine consumption in different age-gender groups, social classes, and patients and each of these studies points to a few factors.

→What this article adds:

Most of the factors affecting the consumption of methamphetamine are related to individual, family, and social factors. Mental disorders, domestic violence, and peer groups are the most important factors affecting methamphetamine consumption.

causes a state called rash or flash (state of maximum pleasure) (7).

Methamphetamine production is relatively simple and inexpensive and is produced in scattered secret laboratories. Substances on this small but widespread scale have been produced by industrial-scale criminal companies since the 1990s. Southeast Asia has emerged as a global hub for the production and trafficking of methamphetamine over the past decade, with 63% of global methamphetamine seizures currently occurring in the region. It is also estimated that more than half of the 15 to 16 million methamphetamine abusers live in Southeast and East Asia. Methamphetamine, because of its increasing use, will lead to human and financial losses and social consequences, such as economic costs, death, suicide, and unsuccessful marriages (8). It is also one of the most dangerous drugs due to its increasing prevalence, its association with risky behaviors of HIV, and other health risks as well as neurological problems such as memory impairment.

Given the fact that young people make up the majority of this substance's consumers and because of its severe negative effects on both physical and mental health, it weakens and disengages society's productive workforce. Failure to fight this great social problem will reduce the socioeconomic and cultural progress of society over time.

According to the rapid assessment of the situation in Iran, the prevalence of methamphetamine use is 5.2% of all drug users, and according to a scientific estimate using the network scale-up method (2013), amphetamine, ecstasy, and LSD abusers were estimated at 299 per 100,000 in Iran (9-11).

Numerous factors have been shown to influence the propensity to use methamphetamine, with studies reporting the various weights and roles of these factors. In the meantime, according to the results, individual and social factors played a more prominent role than other factors (12-14).

Even though numerous studies have been conducted to determine the factors that impact methamphetamine usage, none have yet been conducted in which all of the aforementioned substances are compiled and the results are presented as a coherent classification. Therefore, the present study was designed and conducted to investigate and categorize the factors affecting methamphetamine use using a model of social determinants of health with a scope review study. Scope review studies consider a wider range of contexts in which different designs are applicable and can be published without a critical appraisal by identifying research gaps (15, 16).

Methods

• Search Strategy

The following databases were used for the search: PubMed, Embase, Scopus, and Web of Science. This search was conducted from January 1, 2008, to April 5, 2022. To select keywords for the search, similar studies and keywords selected by the research team and words related to methamphetamine were used in the mesh database. These keywords were searched in the title, abstract, and keyword fields using advanced options and AND and OR operators. Keywords used for this purpose were as follows:

((methamphetamine) OR (deoxyephedrine) OR (Desoxyn) OR methamphetamine hydrochloride) OR (Madrine) OR (methamphetamine) OR (n-methylamphetamine)) AND ("drug dependence" OR "substance use" OR "substance abuse" OR "drug consumption" OR "drug use" OR "drug abuse" OR "drug misuse").

Magiran and Sid databases were used to extract Persian articles. The keywords "drug use" and "methamphetamine" were searched in the title or summary of articles. This study is a phase I study titled 'Future Studies of Consumption of Substances Containing Methamphetamine' and methamphetamine was one of the main keywords used in reviewing studies.

The researcher conducted a first examination of the title and abstract of all retrieved documents after removing overlaps and investigating them. In the second stage, the available full text of the relevant articles remained from the first stage which reviewed by the researcher. The inclusion and exclusion criteria in this study are presented in Table 1.

• Data Extraction

After the final selection of articles, data were extracted from the full text of the articles. The data were divided into 2 separate sections. The first section of the bibliographic data of the articles included the article title, publication year, first author, and journal-title. In the second section, based on the research framework, related topics, which were mentioned in the results of the articles, were extracted. The bibliographic information of the articles is presented in Table 2.

Data Analysis Method

From 42 papers, factors influencing methamphetamine use were qualitatively extracted. Finally, major findings, including a review of important criteria and indicators, were collected and coded in the form of a table.

Table 1. Inclusion and Exclusion Criteria

Criteria	Included	Excluded
Language	Language: Articles published in English and Persian.	Articles published in languages other than Persian and English.
Time	Studies in the time range from 1-1-2008 to 5-4-2022 were accepted	Studies outside the specified time frame
Type of article:	Original article, review, letter, editorial, conference paper, communication	Online books
Content of article:	Articles whose findings were based on the purpose of the study (studies in which the factors and components affecting the use of methamphetamine were mentioned).	Studies that focus their effects on individual therapeutic and physiological aspects.

Table 2. Article Bibliography

Nu	Title	Author name	Year	Journal	Country	Method	Research community	Gender	Result
1	Methamphetamine use behaviors and gender differences (9)	Brecht ML1, O'Brien A, von Mayrhauser C, Anglin MD	2004	Addictive Behaviors	Los Angeles County	Cross-sectional	clients from a large publicly funded treatment system and examines	Male/female	numerous problems related to MA use are including paranoia, violent behavior, hallucinations, financial problems, and legal and work problems
2	Investigating the role of addiction in motorcycle accidents in Mashhad. Journal of Shahid Beheshti School of Nursing and Midwifery (18)	Araghi Ezat, Vahedian Mohammad	2007	Advances in Nursing and Midwifery	mashhad	descriptive research	Addicted motorcyclists who have been hospitalized due to an accident	Male	Improving knowledge, cultural beliefs, and safe alternative recreational activities, legislating strict laws and controlling borders are ways to restrict tendency to addiction and the resultant reduction of accidents.
3	Crystal methamphetamine use among young adults in the USA (36)	Bonita J Iritani , Denise Dion Hallfors, Daniel J Bauer	2007	Addiction	USA	Cross-sectional analyses	respondents aged 18–26 years	Male/female	Gender of residence and offspring have a significant relationship with substance use

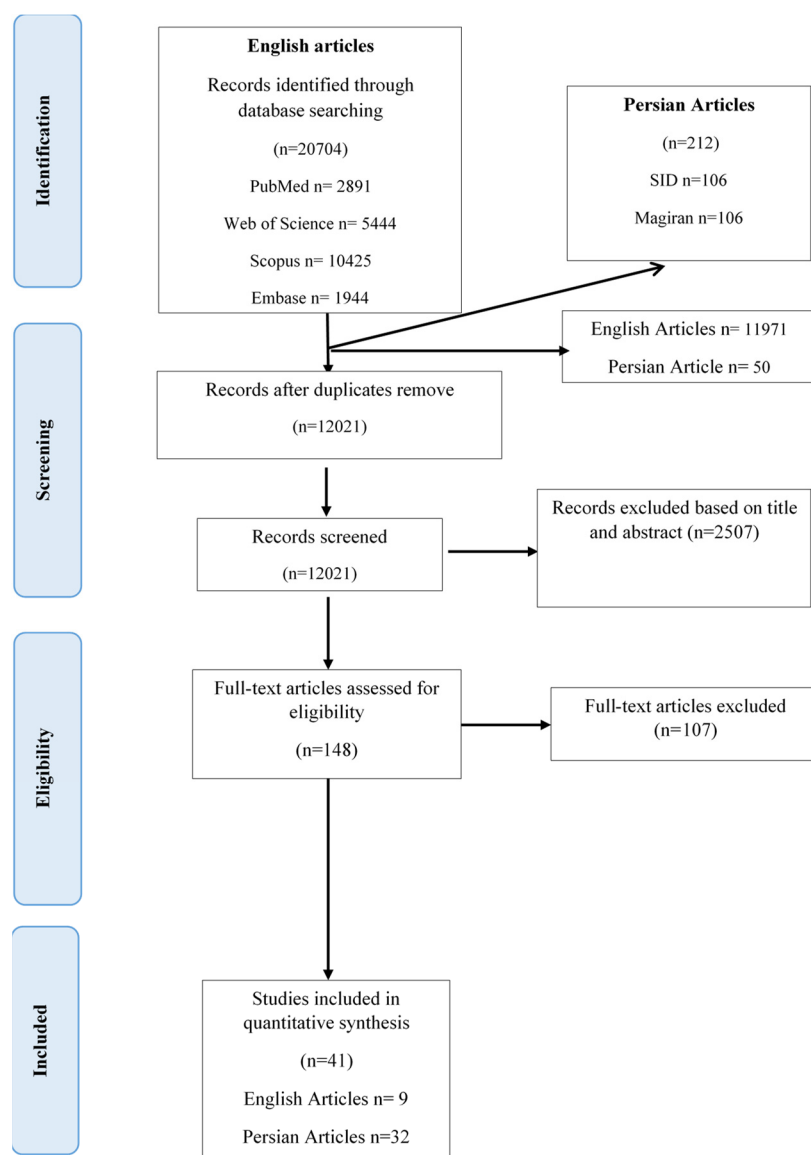

Figure 1. Process of study selection

In addition, after categorizing the content and deleting unnecessary items, the major and most significant findings were extracted and assessed. The number of articles retrieved in each step in different databases is given in Figure 1.

Results

A total of 41 studies were reviewed, of which 32 were published in Persian and 9 in English. Finally, based on the findings of the current study, all variables relating to the use of methamphetamine were divided into 3 primary theme categories: individual, family, and social factors, as well as 13 themes and 64 variables. The bibliographic characteristics of the articles are presented in Table 1.

Four major themes—physical, personality traits, psychological and emotional, and individual-social variables—were found to be related to the category of individual factors. Also, 25 factors were identified, among which 36 articles mentioned these themes. Mental disorders, curiosity, religion, a pattern of use, and a history of substance use

were among the factors that were cited by most articles. Moreover, factors such as low self-confidence, aggression, and lack of life skills were among the factors that were cited by fewer articles (Table 3).

Concerning the main theme of family factors, 3 themes of socioeconomic, emotional, and communication environment of the family and addiction in the family were identified. Also, 12 factors were identified, which were mentioned in a total of 10 articles. Domestic violence, family disputes, and parental divorce were among the factors cited by most articles. On the other hand, fewer articles referred to factors such as the emotional and communication environment of the family and high wealth and well-being (Table 4).

About the main themes of social factors, 6 themes of living environment and communication network, unsuitable environment, social factors, economic, political, managerial, and cultural factors were identified. Also, 27 factors were identified and were among the factors cited by most articles, which were mentioned in a total of 16 articles and

Table 3. Main theme of individual factors related to methamphetamine use

Main theme	Factor Code	Description	References
Physical dimension	Genetic factors	Genetic transmission of tolerance thresholds from parents to offspring through genetics	(14)
	Sex	According to some articles, methamphetamine use has been reported the same and even more often in women than men.	(10, 36, 42, 56, 57)
	Age	The age of onset of drug use, especially methamphetamine, has reached adolescence	(40, 57, 58)
	IQ	IQ can be one of the factors influencing people's tendency toward substances	(22)
	Weight loss	Some women use methamphetamine to lose weight.	(44)
	Physical pain / Pain relief / Physical illness / Premature ejaculation / Incurable diseases	Reducing the pain caused by incurable diseases	(20, 22)
Personality traits	Peace	Achieve peace and achieve a happier life	(44)
	Emotional Intelligence		(39)
	Ambition	There is a relationship between irrational ambition and addiction.	(20)
	Have a spirit of curiosity/ adventure	One of the important personality factors of addicted people is curiosity.	(20-22)
	Recreation / gaining pleasure / physical pleasure	The person has first used drugs for pleasure and entertainment.	(9, 10, 21, 38, 43)
	Low self-confidence	Low self-confidence has been identified as a personality factor among addicts.	(59)
	Introversion and extroversion	Introversion and extroversion have been identified as personality factors of addicts.	(22)
Psychological and emotional factors	Feeling lonely and isolated	Feeling lonely and isolated has been reported to be an important factor in substance abuse.	(43)
	Mental Disorders / Mental Problems / Psychological-Emotional Stress Mental Disorder	Psychological problems have been reported to be an important factor in substance abuse.	(9, 18, 19, 23, 24, 40, 49, 54, 58)
	Depression	Depression has been reported to be one of the major causes of substance abuse.	(22, 28, 49, 50)
	Violence	Aggression is directly related to substance abuse.	(26)
	Anxiety	Anxiety has been diagnosed as one of the psychological problems of drug abusers.	(39, 49, 60, 61)
	Love failure	Love failure has been identified as an individual factor in substance abuse in some drug abusers.	(22)
Individual-social factors	Religion	Having a deep religious connection is inversely related to addiction.	(26, 28, 43, 46)
	Education level	Drug abusers' education level is one of the factors in their tendency toward drugs. One study reported having a lower than a high-school education (middle school) as a factor leading to substance abuse.	(18, 25, 30, 34, 40, 47, 52, 54)
	Job	Job type and work environment are one of the factors leading to substance abuse.	(7, 40, 45, 48)
	Monthly income	High household income has been reported in some studies as a factor leading to methamphetamine use.	(33, 40, 45, 52, 53)
	Marital status of drug users in general	The marital status of drug users is one of the factors affecting drug use.	(45, 48, 61)
	Consumption pattern and history of substance use	History of substance use in the individual and his/her family is one of the important factors leading to drug abuse.	(21, 40, 42, 48, 60)

included the influence of friends and peers, school and academic failure and access to drugs, unemployment, poverty and inequality, and the emergence of new cultural anomalies associated with methamphetamine use at night parties. On the other hand, the existence of a criminal environment and place of residence, war, political climate, and inflation were among the factors cited by fewer studies (Table 5).

Discussion

Addiction is a multidimensional and multifactorial issue that has affected all societies today. By causing psychological and bodily trauma, this problem not only hurts the person but also their family. There is also a direct link between

drug abuse and cardiovascular, renal, and pulmonary diseases, as well as HIV and hepatitis. Methamphetamine use among young people around the world is increasingly shifting from traditional to industrial drugs. Adverse physical effects of this substance include cardiovascular system failure, pulmonary problems, imbalance, epilepsy, and coma. It is important to remember the risks of sexually transmitted diseases like AIDS and hepatitis as well as the loss of life, financial burdens, and other negative social and economic effects resulting from the abuse of this novel substance (17).

Considering the foregoing, society also suffers heavy losses due to methamphetamine use and the treatment and

Table 4. The results of the study related to the main theme of family factors affecting methamphetamine consumption

Main Theme	Codes of Factors	Description	References
Socio-economic	Parents' level of education	Parents' high level of education reduces the likelihood of addiction among their children.	(22)
	Low family income	Low family income can be one of the effective factors leading to addiction.	(22, 53)
	Great wealth and prosperity	High wealth and well-being can be one of the factors leading to addiction.	(22)
The emotional and communication environment of the family	Lack of parental supervision over the person	Lack of parental supervision is one of the important factors leading to addiction.	(22)
	Lack of emotional environment and family disintegration	Lack of family emotional environment can be one of the important indirect factors leading to addiction among children.	(55, 58)
	Lack of attachment to family/family belonging	Lack of attachment to family/family belonging can be one of the most important indirect factors leading to addiction among children.	(54, 58)
	The severity of family disputes	The severity of family disputes is one of the direct influencing factors leading to addiction among people.	(9, 55, 62)
	Type of domestic violence of drug abusers	Violence in the family of drug abusers, especially between parents, is one of the factors influencing drug abuse.	(21, 38)
	Parental divorce	Parental divorce is one of the factors that lead children to addiction.	(9, 22)
	Death of family members	The death of family members is one of the factors that indirectly lead people to addiction.	(43)
Addiction in the family	Addicted parents/family (father, mother, sister, or brother)	Family addiction is one of the direct factors influencing drug abuse.	(22, 52)
	Addicted spouse	An addicted spouse can be a direct factor influencing drug abuse.	(9, 28)

rehabilitation of addicts. Therefore, policymakers and planners can take effective steps by identifying the factors affecting drug abuse through preventive measures to reduce harm to society and improve the level of public health.

Some of the most important known themes among the main themes of individual, family, and society include psychological disorders, psychological-emotional stress, entertainment, curiosity, domestic violence of drug abusers, family disputes, parental divorce, the influence of friends and peers, access to drugs, unemployment, poverty, and lack of access to service and support systems.

Regarding the main theme of individual factors, psychological disorders are one of the most important themes mentioned in the present study and many articles have cited them as one of the most important factors affecting methamphetamine use by young people. Methamphetamine is one of the drugs that some people use to get relief from stress, boredom, and failure in the areas of education, business, and relationships. After consuming these drugs, the person feels indifference, carelessness, and immediate pleasure, and this is what leads the person to use drugs again (18, 19). Young people are more likely to turn to drugs because of their curiosity and their desire to take risks. Therefore, one of the important factors cited in the present study is curiosity (20-22).

The results of the present study also showed an effective relationship between religion and drug abuse. In this regard, Califano (2001), Smith (2001), Zohoor & Tavakoli (2002) and, many others have pointed to the inverse relationship between religion and the tendency to drug abuse (23, 24).

Aggression is one of the factors cited by many articles. Aggression is, directly and indirectly, related to drug abuse

among adolescents because aggressive adolescents are more neglected by their parents. Moreover, due to their low self-esteem, adolescents look for a group of peers and a place to find a new and approved identity, and this is the circle of bad friends (25, 26). Friend gatherings and parties are the best places to try new drugs like methamphetamine for curious teenagers.

Hamednia et al have identified family conflicts, parental supervision of children, and relationships with friends and peers as the most important factors influencing people's tendency to drug abuse. In the present study, a large number of articles have referred to domestic violence and family disputes and a small number of articles have referred to the emotional environment of the family. Thus, there is no sincere relationship between parents and family members in families where there are severe differences and tensions. Mink et al also stated that one of the factors that lead to drug abuse is the lack of attachment to parents. Insecure attachment causes depression and anxiety, which is also regarded as one of the most important factors influencing people's tendency to drugs in this study. In this situation, parents are not able to communicate properly with their children and do not have proper supervision of their children. Parental conflict creates an unsuitable and uneasy environment for children and leads to a higher tendency to find their friends and peers. They would also spend most of their free time with bad friends and have fun with them and enjoy themselves. They are impacted by these hobbies, which are frequently unhealthy and result in high-risk conduct, making them more inclined to consume drugs. Parents' divorce is one of the factors affecting children's substance use. This social problem reduces parents' support for

Table 5. Results of studies on the main theme of society affecting methamphetamine use

Main Theme	Code of Factors	Description	References
Living environment	Address	Place of residence indirectly can be one of the factors that lead people to addiction.	(36)
	School and academic failure	School and academic failure are among the factors that lead people to drugs.	(28, 47, 50)
Communication network	Friends and peers	One of the important factors that cause people to use methamphetamine is participating in a group of friends and peers.	(9, 21, 28, 37, 39, 42, 50)
	Access to drugs	Most of the literature reports simple and easy access to drugs as one of the important factors that lead people to addiction.	(32, 38, 43)
	Existence of a criminal environment	A criminal environment makes access to drugs easier and simpler.	(22)
Social factors	Population growth	Population growth can indirectly affect people's tendency towards addiction.	(22)
	The structure of society	The structure of society, especially now that we have a young structure, can indirectly affect people's tendency towards addiction.	(22)
	Migration	Migration can indirectly affect people's tendency towards addiction.	(43)
	Social injustice/discrimination	Social injustice is one of the factors that lead to addiction.	(22)
	Social gap / Social Conflicts and Contradictions	Social gap/ Social conflict is one of the factors that lead people to addiction.	(22)
	The feeling of social disgust	Feelings of social disgust are one of the factors that lead people to addiction.	(28)
Economic factors	Industrial Development	Industrial development is one of the factors that lead people to addiction.	(22)
	Lack of job opportunities	Lack of job opportunities causes unemployment and directly affects people's tendency to addiction.	(22)
	Unemployment	Unemployment is one of the important factors influencing people's inclination towards methamphetamine use.	(21, 22, 28, 37)
	Poverty and inequality	Poverty and inequality are among the socioeconomic factors that lead to addiction.	(36)
	Inflation	Inflation indirectly affects the tendency of people to become addicted.	(21)
	Recession	The economic crisis indirectly affects people's tendency towards addiction.	(21)
Political and managerial factors	Political and managerial factors	Appropriate information policies about the effects of addiction have an important role in primary prevention, so rapid educational programs and awareness through the media and cyberspace are important solutions to deal with this ominous phenomenon in society and to keep teenagers and young people from falling into the addiction.	(22)
	Preventive and disciplinary interventions and policies	Implementation of primary prevention programs in society is one of the factors reducing the tendency toward addiction. Also, close monitoring of law enforcement agencies on the sale and distribution of various drugs is a good deterrent to the spread of addiction in society.	(22)
	Support and counseling service systems	Support and counseling service systems play a very important role in returning healthy people to society before and after drug abuse.	(22)
Cultural factors	Reducing dependence and belonging to society and values:	Decreased dependence and attachment to society and values can indirectly affect people's tendency to addiction.	(38)
	The emergence of a new cultural anomaly of drug abuse, as sweets of night parties	The emergence of a new cultural anomaly of drug abuse, such as sweets of night parties, has led to an increase in industrial substances, including methamphetamine, among young people.	(41)
	Mass media and internet, satellite	Mass media and the Internet, and satellites indirectly affect the consumption of industrial substances such as methamphetamine.	(61)
	Medical rumors	Some people use methamphetamine to lose weight	(42)
	Advertising (considers drug abuse to be effective in relieving thoughts and reducing mental problems)	People use drugs, including industrial ones, to achieve peace of mind.	(21)
	Expansion of media in villages	The expansion of media in rural areas can be effective in preventing drug abuse	(37)

their children and increases the chances of the use of various substances among adolescents. On the other hand, drug addiction is more prevalent among young people belonging to single-parent families. Children, particularly girls, leave their homes and schools in this environment and are attracted to criminal gangs, and develop addictions. In the family main theme category, parents' addiction can also be one of the factors influencing drug use. Children raised

within a family system with addicted parents, choose them as their role models and play their role in society. The majority of young people who develop addiction are those whose parent(s) are addicts; as a result, parental drug use makes children curious, which is one of the factors influencing drug use and leads them to believe that addiction is a common practice and is a trait of adults who turned to drugs. On the other hand, addicted parents are less likely to

monitor and control their children, which increases the likelihood of child addiction. Unemployment is one of the significant topics addressed in the current study and supported by other studies when it comes to the primary category of society. This factor as a social phenomenon leads to other deviations, especially addiction. Unemployment leads to various perversions such as addiction, not only due to the failure to meet economic issues and ensure the material and spiritual well-being of family members but also by disrupting personality strength, moral stability, magnanimity, hope for the future, and individual authority. Teenagers spend most of their time in coffee shops and cafeterias, and these places are the best places for selling and consuming drugs (24, 27).

Both poverty and mental diseases like despair, hopelessness, and loss of confidence are consequences of unemployment, all of which by themselves have an impact on substance use. Unemployment is an underlying factor that can, along with other factors such as poverty, lead to addiction. Since financial difficulties force the poor individual to become addicted, the relationship between poverty and addiction is a 2-way street as well. On the other hand, the addicted person becomes weak loses the will to work and suffers from elevated poverty levels.

Another significant aspect that contributes to the propensity for drug usage is the formation of new cultural oddities connected to drug use, as well as hosting night parties. Communicating with friends and acquaintances at night parties, gaining pleasure, curiosity, depression, feelings of worthlessness, and mental disorders are among the important factors that lead people toward drug abuse.

Because young people and adolescents are now heavily influenced by cyberspace, political and managerial measures to inform them can be conducted through this medium. By creating educational content, young people can learn about the harmful consequences of methamphetamine usage. To stop the circulation of industrial narcotics such as methamphetamine, which has no odor and is portable, sanctions and legal action should be taken against those who use and distribute them. In this category, there is a significant relationship between place of residence and the tendency to use psychotropic substances and drugs. For example, students who lived outside their place of residence, such as in dormitories and rented houses, were more likely to become addicted. Also, in some neighborhoods, access to drugs is simple and easy, and it allows residents to access drugs without difficulty and under any circumstances.

Most addicts cited communicating with bad friends as the cause of their addiction. Adolescents are more affected by their peer group than ever before during adolescence. After family, friends are the second most fundamental factor that has the greatest impact on the formation of personality, as a person is considered a member of the group of friends when they accept their accepted values and norms and act according to them.

The school environment is also one of the important factors affecting adolescents' tendency to drug use (28, 29). As a result of the increased sense of belonging to the school, the likelihood of being addicted will decline. Students who feel like they belong at school refrain from risky behaviors

like using violence and binge drinking, and they also urge their peers to do the same. Being a part of a school community significantly lowers risk-taking and high-risk behaviors including fighting, bullying, vandalism, dropping out of school, and drug and alcohol misuse. In other words, when students are supported and respected by teachers and are praised for academic contributions, they show less tendency toward different types of drugs (30).

The results of a study showed a significant relationship between school culture components, including student relationships, student-teacher relationships, and educational opportunities with students' addiction tendencies. School culture—including beliefs, attitudes, and student-student behaviors—is effective in children's mental atmosphere, morals, and education. In other words, the better and higher the school culture, the lower the addiction tendency will be, and vice versa (30, 31).

In the present study, one of the important factors affecting substance use is access to substances. Mirshamshiri et al and Khosravi et al have mentioned the availability of drugs as one of the important factors that induce the tendency towards addiction. Human beings tend to use a substance that is easily available to them. The experiences of other countries, including the United States and Nepal, in the release of some drugs, have shown that the use of these drugs has not only not decreased but also increased at this time. Moreover, girls have sometimes engaged in prostitution to buy drugs in Nepal. The rate of drug intake will increase if medicines are more widely available and less easily obtained at a reduced cost and danger. Therefore, living in neighborhoods where access to drugs is easier is also known as one of the important social factors in the onset and persistence of drug addiction (32-34). According to previous studies, those from lower social classes, those with less education, the unemployed, those who live in slums or rented homes on the outskirts of cities, and those from these groups are more likely to engage in social deviations (35).

Strengths and Weaknesses

The present study had limitations such as time and language for search. Lack of access to the full text of some articles, and temporary lack of access to some databases were also limitations of this study. Due to the use of extensive keywords, a large number of documents were obtained, which can reduce the accuracy of information extraction. Since we had no age or gender restrictions, we included all types of demographics, and this can be a strength of the study. However, given the significance of the topic, in-depth research is needed, along with expert team collaboration across all databases.

Conclusion

The results of the present study showed that most studies cited individual factors, society, and family factors, respectively. This indicates the predominance of the individual approach used in studies of methamphetamine use and fewer studies have cited societal factors that indicate a research gap with social approaches and the need to expand this type of study in this field. Fewer studies also mentioned

the role of family factors; in this regard, more emphasis can be placed on empowering families in the proper way of communication between parents and children and creating a positive and lasting emotional bond between them as a protective factor.

In all of the individual factors, mental disorders, family disputes, addiction in parents, the influence of friends and peers, and access to drugs were important and influential factors that lead to methamphetamine use. To give adolescents a suitable place to spend their free time, it is advised that policymakers in this area concentrate more on counseling services programs tailored for these age groups in schools and offer adequate and affordable recreational services in homes. Effective steps can be taken to reduce the number of methamphetamine abusers by improving economic conditions and increasing social capital in the communication network of adolescents and young people simultaneously with the establishment of strict regulations to prevent easy access to this substance in living environments.

In the present study, a group of important factors was found in various fields, which indicates that decision-making and policy-making in this field are better based on attention to these factors in the form of a causal network and dynamic interaction between these factors.

Acknowledgment

The authors express their special thanks to Kerman University of Medical Sciences for funding this research, and to the participants who take part in this project.

Authors' Contributions
